

**SUPPLEMENT: B2 Exam READING PART 1 Practice:**

⚡ REMEMBER - there

Complete the following texts by filling in the proper **word** for each of the blank spaces (1 – 15). *will only be 10*

Write ONE WORD ONLY in each space.

*on the B2 EXAM*⚡ Pay Attention! Use **ONLY ONE** word.**TEXT 1:**

In a very rare case, an eight-year-old boy has developed an allergy (1) \_\_\_\_\_ fish and nuts - foods that he used to be fine with - after receiving a blood transfusion (2) \_\_\_\_\_ treatment for a type of brain cancer. The case study was published in the Canadian Medical Association Journal this week.

Weeks (3) \_\_\_\_\_ the transfusion, the boy began experiencing severe anaphylaxis within minutes of eating salmon, and then again after eating a chocolate peanut butter cup, Live Science reports. Blood and skin prick tests revealed (4) \_\_\_\_\_ he was (at least temporarily) allergic to nuts and fish.

When people (5) \_\_\_\_\_ food allergies donate blood products like plasma or platelets, they might end (6) \_\_\_\_\_ transferring a protein called immunoglobulin E (IgE), an antibody that reacts against allergens. (7) \_\_\_\_\_ can stay in the blood products even after a month of storage, and when it meets up with specific allergens, it causes the body's immune cells to release histamine and similar chemicals to stir up an allergic reaction.

But people with allergies aren't really screened or barred from donating blood in Canada or in the U.S. For (8) \_\_\_\_\_ thing, multiple events must come together for a recipient to develop a new allergy this way, Scientific American explains: The donor must have high levels of IgE antibodies, a substantial amount of blood product must be received, and the recipient must (9) \_\_\_\_\_ exposed to the specific allergen the antibodies react against within a tight window frame of a few months.

"It is very unusual to identify someone (10) \_\_\_\_\_ experienced passive transfer of allergy from blood products," says Julia Upton of the Hospital for Sick Children (known as SickKids) in a news release. While rare, it can still (11) \_\_\_\_\_ in anaphylactic reactions to foods that were happily consumed (or at least tolerated) without triggering (12) \_\_\_\_\_ reactions in the past. The symptoms - (13) \_\_\_\_\_ can range from sudden fatigue to throat discomfort and facial swelling - should be treated immediately.

Upton adds: "Importantly, this condition has an excellent prognosis and typically resolves within a few months." Blood tests revealed how the boy's IgE levels to salmon and peanut were undetectable about five months (14) \_\_\_\_\_, Live Science reports. And by the half-year mark, his parents were able to gradually reintroduce nuts and fish back into (15) \_\_\_\_\_ diet.

**TEXT 2:**

The axeman of New Orleans is a serial killer (1) \_\_\_\_\_ was known for being active throughout New Orleans, Louisiana, from May 1918 to October 1919. The victims of the axeman (2) \_\_\_\_\_ killed with an axe that was, in some cases, also used to (3) \_\_\_\_\_ down the door of the home. (4) \_\_\_\_\_ there were some ideas as to who the axeman could be, there was no evidence strong (5) \_\_\_\_\_ to convict anyone of the crime. Unlike many other serial killers, the axeman appeared to attack completely (6) \_\_\_\_\_ random and with complete disregard for his victims and not all of those victims died (7) \_\_\_\_\_ a result of their wounds. So random (8) \_\_\_\_\_ his attacks that victims of the axeman included a pregnant woman and a young infant killed (9) \_\_\_\_\_ its mother's arms.

The axeman continued to taunt the city with his crimes and even wrote letters to local newspapers in (10) \_\_\_\_\_ he claimed to be a demon from Hell. The axeman seemed to enjoy the power that he held (11) \_\_\_\_\_ others more than anything else and in one famous incident he wrote a letter to a local newspaper stating that he would strike again at fifteen minutes after midnight on March 19; however, any location where a jazz band was playing would (12) \_\_\_\_\_ spared. Jazz music abounded that night and there were no killings. There are twelve identified victims of the axeman of New Orleans.

There were many speculations as to who the axeman could have been; one such speculation indicated that perhaps the mafia was involved (13) \_\_\_\_\_ the killings; however, the later crimes which included the murdering of the young infant were not characteristic of such a murderer. There was also rumor that a man named Joseph Momfre was responsible for the crimes and was eventually murdered (14) \_\_\_\_\_ the widow of one of his victims; however, there is (15) \_\_\_\_\_ evidence to indicate that this is actually true.
